

Why use a Software-as-a-Service (SaaS)-based TMS?

Over 50% of all software today is offered in a software-as-a-service (SaaS)-based format. Being in the Cloud means that you can:

- » Access your business information whether at the office, at home, or traveling
- » Access it across different devices (desktop, laptop, tablet...)
- » Avoid large capital investments in servers and expensive IT staff

Benefits of a Web-based SaaS TMS

No More 'Maintenance' Fees

Software-as-a-Service is exactly that—a service. And with it, there are no more annual maintenance agreements and contracts that land with a thud on your desk. So now, rather than paying 25% of your original purchase price for annual software upgrades and bug fixes, **you get the latest version every time you login—at no extra cost.**

Low or No Capital Investment

Legacy systems often require outlays of cash up-front, which is a big hit to a company's cash-flow. Couple that with longer implementation times, an investment in a server, plus hiring or contracting expensive technical labour to keep it running.

Scales with Your Company as you Grow

You no longer have to guess at the number of licenses that you need to buy up-front. You can add or drop subscriptions according to the needs of your business.

Accessibility

You can access the application through multiple devices—desktops, laptops, tablets, phones—wherever you have access to the internet.

Tie into Your Other Key Business Systems

A true web-based SaaS TMS should have an open Application Program Interface (API) layer to allow you to adapt it even more tightly to your needs.

Price

Would you pull up to a gas station if its gas pricing wasn't posted for all to see? You might even wonder, *'What are they hiding?'*

The price for most SaaS-based TMS systems is explicitly published on a website, or on a product sheet: **the monthly per user price for the Tailwind TMS is \$69 for Standard, \$99 for Pro (most popular tier) and \$139 for Enterprise.**
